Their goal in creating the inventory was to create a set of questions that could be applied towards assessing different types of anxiety. [citation needed]

The State-Trait Anxiety Inventory (STAI) is a psychological inventory based on a 4-point and consists of 40 questions on a self-report basis. It can be used in clinical settings to diagnose anxiety and to distinguish it from depressive syndromes. The STAI measures two types of anxiety - state anxiety, or anxiety about an event, and trait anxiety, or anxiety level as a personal characteristic. [] It was developed by psychologist Charles Spielberger, R.L. Gorsuch, and R.E. Lushene. This was a new development because all other questionnaires focused on one type of anxiety at the time. It also is often used in research as an indicator of caregiver distress Form Y, its most popular version, has 20 items for assessing trait anxiety and 20 for state anxiety.

State-Trait Anxiety InventoryPurposemeasures 2 types of anxietyThe State-Trait Anxiety Inventory (STAI) is a psychological inventory based on a 4-point Likert scale and consists of 40 questions on a self-report basis. Higher scores are positively correlated with higher levels of anxiety Its most current revision is Form Y and it is offered in 12 languages. " Trait anxiety items include: "I worry too much over something that really doesn't matter" and "I am content; I am a steady person... Higher scores are positively correlated with higher levels of anxiety Its most current revision is Form Y and it is offered in 12 languages. • New Users: Please register, then proceed to purchase the article University Of South FloridaDescription of Measure: The State-Trait Anxiety Inventory (STAI) is a commonly used measure of trait and state anxiety (Spielberger, Gorsuch, Lushene, Vagg, & Jacobs, 1983). " All items are rated on a 4-point scale (e.g., from "Almost Never" to "Almost Always").
